XLMR with Epilepsy: \textit{ATP6AP2} Gene Deletion/Duplication

\textbf{Test Code:} DATP2  
\textbf{Turnaround time:} 2 weeks  
\textbf{CPT Codes:} 81228 x1

\textbf{Condition Description}

Intellectual disability (ID) is a nonprogressive cognitive impairment affecting 1-3\% of the Western population. It is estimated that up to 50\% of moderate-severe cases have genetic causes and approximately 10\% are due to X-linked intellectual disability disorders (XLID). XLID can be syndromic or nonsyndromic and is observed in all ethnic groups. More than 100 XLID syndromes have been described in the literature to date. Fragile X is the most common XLID syndrome (~1 in 4000 males) while others can be quite rare with only a few patients reported in the literature. Males can have moderate to severe intellectual disability depending on the syndrome, and carrier females can also be affected, but typically have milder clinical symptoms.

Hedera et al. evaluated a family with intellectual disability and epilepsy that was inherited as an X-linked trait. Affected individuals had mild to moderate intellectual disability and tonic-clonic seizures. The age of onset for seizures varied from four to 14 months of age and the frequency ranged from 20 seizures per day to several seizures per month. There was no history of psychomotor regression once the seizures began. In addition to intellectual disability and seizures, the affected family members had developmental delay, speech delay, normal hearing, and no dysmorphic features.

A silent mutation (p.D107) in the \textit{ATP6AP2} (Xp11.4) gene was found to segregate in this family. This change was not identified in 1200 X-chromosomes of healthy controls.

For patients with suspected XLMR with epilepsy, sequence analysis is recommended as the first step in mutation identification. For patients in whom mutations are not identified by full gene sequencing, deletion/duplication analysis is appropriate.

\textbf{References:}

- OMIM \#300556: \textit{ATP6AP2} gene  
- OMIM \#300423: XLMR with Epilepsy

\textbf{Genes}

\textit{ATP6AP2}

\textbf{Indications}

This test is indicated for:

- Confirmation of a clinical diagnosis of XLMR with epilepsy in an individual in whom sequence analysis was negative.  
- Carrier testing in adults with a family history of XLMR with epilepsy in whom sequence analysis was negative.

\textbf{Methodology}

DNA isolated from peripheral blood is hybridized to a CGH array to detect deletions and duplications. The targeted CGH array has overlapping probes which cover the entire genomic region.

\textbf{Detection}

Detection is limited to duplications and deletions. The CGH array will not detect point or intronic mutations. Results of molecular analysis must be interpreted in the context of the patient's clinical and/or biochemical phenotype.

\textbf{Specimen Requirements}

\textit{Submit only 1 of the following specimen types}

\textbf{Type: Whole Blood (EDTA)}

\textbf{Specimen Requirements:}

- EDTA (Purple Top)  
- Infants and Young Children (2 years of age to 10 years old): 3-5 ml  
- Older Children & Adults: 5-10 ml  
- Autopsy: 2-3 ml unclotted cord or cardiac blood

\textbf{Specimen Collection and Shipping:}

Ship sample at room temperature for receipt at EGL within 24 hours of collection. Do not refrigerate or freeze.

\textbf{Type: DNA, Isolated}
Specimen Requirements:
Microtainer
3µg
Isolation using the Perkin Elmer™Chemagen™ Automated Extraction method or Qiagen™ Puregene kit for DNA extraction is recommended.

Specimen Collection and Shipping:
Refrigerate until time of shipment in 100 ng/µL in TE buffer. Ship sample at room temperature with overnight delivery.

Special Instructions
Sequence analysis is required before deletion/duplication analysis by targeted CGH array. If sequencing is performed outside of EGL Genetics, please submit a copy of the sequencing report with the test requisition.

Related Tests
- Sequence analysis of the ATP6AP2 gene is available and is required before deletion/duplication analysis.
- Custom diagnostic mutation analysis (KM) is available to family members if mutations are identified by targeted mutation testing or sequencing analysis.
- Prenatal testing is available only for known familial mutations to individuals who are confirmed carriers of mutations. Please contact the laboratory genetic counselor to discuss appropriate testing prior to collecting a prenatal specimen.
- X-Linked Intellectual Disability panels are available for 30, 60, and 90 genes.
